SOHAIL SHAIK

Full-Stack AI Engineer

+91 96426 39515 — s.suhail9849@gmail.com — github.com/Sohail-9 — LinkedIn

PROFESSIONAL SUMMARY

Full-stack AI engineer with 3+ years building production systems across React/Next.js, Node.js, Python, and PostgreSQL, with a focus on LLM orchestration and RAG pipelines. As a founding engineer, built an AI platform from scratch, including sandboxed code execution and deployment infrastructure, that grew to 4,000+ beta users and 500+ daily active users.

TECHNICAL SKILLS

AI/LLM: RAG, multi-agent systems, LLM orchestration, MCP, OpenAI, Anthropic, Gemini
Backend: TypeScript, Node.js, Python, REST APIs, WebSockets, microservices
Frontend: React, Next.js
Cloud/DevOps: AWS, Docker, Kubernetes, CI/CD
Databases: PostgreSQL, Redis, MongoDB, pgvector

WORK EXPERIENCE

Founding Engineer — PrettiFlow **Jan 2026 – Present**
Remote (San Francisco, USA)

- Built a full-stack AI platform that turns natural-language prompts into deployed applications, growing it to 4,000+ beta users and 500+ daily active users.
- Cut full-stack build time from 15 to 8 minutes by redesigning the pipeline from prompt intake through code generation, provisioning, and live deployment.
- Reduced cold-start latency from ∼3s to ∼100ms by building a pre-warmed sandboxed code execution environment, streaming results to the frontend over Redis Pub/Sub and WebSockets.
- Built a cross-platform CLI covering infrastructure provisioning, deployment automation, and AI-assisted development workflows.
- Added safety guardrails, including input/output sanitization, action-level blocking, and loop detection, directly into the execution layer.

Software Engineer — OmniqAI **Jan 2023 – Dec 2025**
Bengaluru, India

- Designed the backend from the ground up for an AI workflow platform, building the services, PostgreSQL schemas, and REST APIs behind automated multi-step reporting powered by LangChain-based RAG pipelines.
- Built the Next.js frontend with real-time workflow status over WebSockets, tied directly to backend job state.
- Built a Confluence-style collaborative docs platform using RAG, pgvector semantic search, and document sharing.
- Built internal MCP servers so AI agents could securely call internal tools, expanding what the platform's agents could do.
- Cut perceived API response time by 30% by moving LLM job handling to Redis queues with WebSocket-based status updates.
- Cut hot-path query latency by 40% and eliminated connection exhaustion under peak load by adding PgBouncer pooling and PostgreSQL partial indexes.
- Integrated Razorpay with signature-verified webhooks and idempotent transaction processing.
- Helped migrate infrastructure from on-prem to AWS (Docker, Kubernetes/EKS), enabling zero-downtime deployments.

TECHNICAL PROJECTS

OctaClaw — Multi-Agent Orchestration Platform *Node.js, TypeScript*

- Built a multi-agent system that splits complex goals into a dependency graph and runs subtasks in parallel across specialist agents for research, code generation, review, and testing.
- Built tool integrations for filesystem, HTTP, email, databases, and Jira, so agents could act on external systems directly.

EDUCATION

Brindavan Institute of Technology and Science **2019 – 2022**
Bachelor's Degree
